

SHORELINE AND HABITAT RESTORATION PROJECT

at

Raymond Park

The Raymond Park Project aims to restore the shoreline and habitat at the park and to provide a demonstration site that will highlight four different habitat types. This project enhances habitat for wildlife, improves water quality and provides an example for homeowners looking to complete restoration projects on their own property.

The map on the reverse side provides more information about the project's **four restoration features**:

- 1) Beach Restoration
- 2) Oak Savanna Restoration
- 3) Shoreline Restoration
- 4) Low-maintenance Grass Addition

This project is partially funded by a Conservation Partners Legacy grant sponsored by the MN Department of Natural Resources and the Lessard-Sams Outdoor Heritage Council.

This year, the Prior Lake-Spring Lake Watershed District, Great River Greening and the City of Prior Lake are working together on a shoreline and habitat restoration project at Raymond Park.

Construction for this project will be completed in 2017, and vegetation maintenance will be ongoing.

Shoreline Restoration

Raymond Ave

Beach Restoration

The vegetation in the beach area was replaced with native plants typically found in a beach plant community. Natural sandy beaches have sparse vegetation which helps stabilize the shoreline, hold the sand in place and provide valuable habitat.

Low-Maintenance Grass

The mowed turf grass areas in the park were re-seeded with low-growing native grass with some flowering forbs mixed in. This grass will require mowing only a few times a year and no fertilizer will be needed, reducing maintenance costs and benefiting the environment.

Oak Savanna Restoration

The wooded area of the park has been restored to an oak savanna habitat. Buckthorn and other non-native, invasive species were removed and the area was re-seeded with native grasses and forbs.

Shoreline Restoration

The remaining shoreline area was enhanced by removing invasive species and seeding the area with native species. Native plants will also be installed along the shoreline as needed to encourage establishment of the shoreline.
